The next level of image editing involves using filters, which distort the color spectrum of an image (as you read in the next section, "Working with Color Filters and Adjustment Layers"). Although filters are also used for film, they are useful in digital photography as well. Adding a filter to an image works by taking the original image and playing with the color or brightness values of individual pixels. A filter has three main types: \* Color filter \* Brightness and contrast filter \* Texture filter Most filters change an image's appearance but don't remove a shot's detail or add any interesting artistic elements. However, as you can see in Figure 8-4, a few filters offer an entirely different look than those offered by the default filter. © John Wiley & Sons, Inc. FIGURE 8-4: Image filters enable you to change the appearance of your image. You don't have to use filters. However, if you take some creative license when you edit your image (see the next section, "Playing with Color Filters and Adjustment Layers"), you can enhance the image and add a unique look. You can also use filters to increase the fidelity of your image. For example, to make an image look like film, you might choose the color filter. To simulate lighting effects or to add an interesting visual texture to the image, you might choose the brightness and contrast filter. When you apply a filter to an image, you can use one of three ways to access that filter. One way is to open the Filter menu (the icon with a filter icon in the upper-left corner) and choose the filter you want to apply. A second way to activate a filter is to choose Filter⇒Filter⇒Advanced or Edit⇒Adjustment⇒Adjust Color⇒Edit. The third way is to choose Filter⇒Filter⇒Adjustment⇒Color⇒Edit. All three methods open the Edit Color dialog box, which enables you to choose the filter and fine-tune its effect.

Fluorescent immunoassay of prostate-specific antigen in immunoglobulin G. Prostate-specific antigen (PSA) is the most frequently used tumor marker for prostate cancer. The reference range for PSA is 0.1-3.4 ng/mL. A fluorescent immunoassay has been developed for the detection of serum PSA. The double antibody sandwich technique was used to capture and detect the PSA, which was labeled with fluorescein by a two-step reaction system. This immunoassay, with a detection limit of 0.05 ng/mL, is simple and less expensive than the standard method. Serum PSA levels obtained by this fluorescence immunoassay showed good correlation with the standard assay ( $R^2 = 0.928$ ). The sensitivity of the assay was comparable to that of a polystyrene tube radioimmunoassay ( $R^2 = 0.907$ ), and the fluorescent immunoassay was 100 times more sensitive than the radioimmunoassay. The intra- and inter-assay coefficients of variation of the fluorescent immunoassay were less than 4.0%.

Q: What's a good way to have multiple instances of a class? I have an application that has a main class. On initial launch, the main class creates several helper classes that are used to further classify things in the application, like classes for different types of clients. The problem is the main class is loaded, and creates the helper classes, and then the helper classes are never used again. I'd like them to be instantiated at any given point in the application, since there's obviously one instance of a client per one instance of the main class. Is there a good way of doing this in .NET? Or, is there a good way to use helper classes elsewhere in the application?

A: If you are using a Service Oriented Architecture (SOA) with services that need to be instantiated and pooled, you should consider a factory like this one: `public class PooledFactory where T : new() { private readonly List<T> _pool = new List<T>(); public IEnumerable<T> EnumerateAll() { return _pool.AsReadOnly(); } public`
