
function that takes in a file with multiple columns of integers and a file with a single column of integers, and outputs a file with each column from each file stacked on top of each other with each corresponding column the same height. I thought I could use the outer for loop and then the function (output) to iterate through each column in the inner loop. I wrote the following script, but I know I am missing something. I was given a sample file with many multi-column sections of integers in a file (I would like to use an input file that I would just rename). For each column from the input file, I want to iterate through each row of integers in the outer for loop. The function is returning an error, though, and I am not sure why.

```
import sys
def crossFile(inpFile,outpFile):
    input = open(inpFile,"r")
    header = input.readline()
    for line in input:
        output = open(outpFile,"w")
        for c in range(len(header)):
            for r in range(header[c]):
                output.write(header[c])
        output.write(line)
crossFile("XXXXXX","out2.txt")
```

Any help is appreciated. I would like the solution to be able to work with multiple files that have more than one column of integers. Thanks!

A: You don't need the inner loop if you're only going to use it in only one place, so you can get rid of it altogether and use range:

```
input = open(inpFile,"r")
header = input.readline()
output = open(outpFile,"w")
for c in range(len(header)):
    for line in input:
        output.write(header[c]
```

Muda" diberikan untuk pembaharuan karakter akademi atau kolektor."Rupa Muda" diberikan kemudahan yaitu kebutuhan untuk kemudahan karakter.Dengan karakter muda diaktifkan, karakter, kolektor yang ialah menjadi karakter yang kuat.Hal ini membuat karakter yang tak kuat lebih kuat, jadi dengan karakter yang kuat kita lebih bisa dapatkan poin penggantian karakter.Rupa Muta dibahas di bahasa Inggris di artikel Flashback. dengan artikel ya disini.[Read more]Q: How to get list of subscribed users to ejabberd during one time? I want to get list of users who are subscribing to a group or server during one time. Is there any other method to get list of users who are subscribing to group or server in ejabberd? A: I want to get list of users who are subscribing to a group or server during one time What you can do is to write a module to do that; in the module start/2 function you can check in the registered state the state of the module and perform what you want. Here are the steps you have to take: add module to your ejabberd.cfg write a function in the module create a file in the ejabberd bin folder with the name of the module and add an echo after the function My example:

```
-module(userlist_inotify). -author("Your Name"). -import(ejabberd, [start/2]). start(Host, Opts) -> case is_module(userlist_inotify) of false -> stop; _ -> case ejabberd_
```
