A: I think you need to right click on the dongle in Device Manager and update the driver. Mark - Two questions -- please respond as soon as possible. 1. Since real time pricing applies to all EPMI EnronOnline deals that are not NYMEX swaps (i.e., all hourly, half-hourly and quarter-hourly transactions), can we be assured of getting real time electronic settlement? Can we be assured of getting real time electronic settlement for the rate swap deals that are NYMEX swaps? 2. Can we be assured of the ability to take a financial position through EPMI's Long Term California - Central Coast Desk? If you will allow me to be a bit more specific, we are considering taking a short position of potential exposure to the California Power Exchange for this next month's market. Can we be assured of the ability to execute this transaction? This will clearly be a very unique and narrow transaction and I'd like to limit the legal and credit exposure for that transaction. Thanks and Regards, Mike Grigsby Manager EPMI Fundamentals 713-853-6878[The effect of HLA and DQB1 haplotype on the clinical outcome of allogenic BMT]. This study was performed to elucidate the influence of HLA-A, -B, and -DRB1 alleles on the clinical outcome of allogenic bone marrow transplantation (BMT). The HLA typing of the donors and recipients was performed using a microlymphocytotoxicity test. The Kaplan-Meier method was used to calculate the probability of an event and of a disease-free interval in patients receiving allogenic BMT and the cumulative incidence of graft failure in the HLA-matched patient group was compared with that in the haploidentical patient group. The following two major haplotypes were found to be frequent in the HLA-A and -B loci: A1, B8 and A3, B7 (20%) and A1, B8, DRB1\*1102, and DRB1\*0803 (15.5%). The following haplotypes were frequent in the HLA-DRB1 locus: DRB1\*0701, DRB1

Golden age of crime The Golden Age of Crime is a period of art that illuminates the topic of crime, whereby a writer attempts to convey the feeling of what it is like to live in the world of crime during the 1990s. There are many writers that were inspired by this time in crime fiction. It began after the events of World War II and the internal displacement of the American public as the value of the United States dollar increased to reflect the strain of war on the economy. Since then, the public has been wary of the negative effects the crime problem could have on the nation. The term "Golden Age of Crime" was coined by author Dennis Lehane. Subgenres "Golden Age" of crime is one of a number of terms used to describe a certain style of crime fiction that began in the mid-1990s. The term focuses on crime fiction having very high production values and attention to detail. The crime writer can create his own police procedural-type story, as well as create another type of crime fiction story that relies heavily on psychological insight into the main character. The writer can also focus on a particular type of crime, such as drug use, or environmental crime (including wildlife crime, such as poaching). The author can also focus on a certain type of crime, such as the gang-related crime, or the copycat crimes. moving target: the Perception of Deception Task. The Perception of Deception Task (PDT) is a visual target recognition task with acoustic distractors. The PDT enables objective comparison of target and distractor processing in neurologically intact and neurologically compromised participants. Here, we provide details for the most recent PDT protocols and describe the results of an initial test of the ability to complete PDT in two individuals with multiple sclerosis (MS). We compare the performance of these participants with published data from patients with other brain disorders that affect oculomotor function. Data from 13 typically developing and 12 neurologically impaired participants completed the PDT at a speed of 10 times per minute. Performances on the PDT were compared with data from the literature. The typically developing participants completed the PDT at a mean of 88% accuracy. There was a high level of variability in performance that was not explained by the neurological impairment of the participants. The MS participants completed the PDT at a mean of 47% accuracy. For this patient group, completion of the PDT was highly associated with the severity of their visual field defects. Our initial data demonstrated that neurologically compromised participants are able to complete the PDT at a mean performance that is indistinguishable from healthy participants. These data demonstrate that the PDT could be used to assess performance
