Sketchbook For Enterprise 2014.A randomized controlled trial assessing the efficacy of the Bionator in improving hand function in children with cerebral palsy. Despite increasing focus on improving hand function in children with cerebral palsy (CP), there is limited evidence of efficacy of hand therapies. This study evaluated the efficacy of the Bionator in improving upper limb function in school-aged children with CP. Twenty-eight children with a diagnosis of CP were randomly assigned to receive a 5-week intervention of the Bionator or standard occupational therapy intervention. Assessments of the primary outcome measure (the Jebsen-Taylor Hand Function Test) and secondary measures (the Assisting Hand Assessment and the Rasch-built Assessment Scale for Kids (RBAS-K)) were made at pre- and post-intervention and at 6- and 12-month follow-up. Significantly greater gains were made in the Bionator group in the primary and secondary outcome measures. In fact, the Bionator group demonstrated significantly greater gains in all four assessments taken together at post-intervention, and this was maintained over the 12-month follow-up. Of the secondary measures, there were significant differences between groups at post-intervention for the RBAS-K assessment of handwriting. Moreover, children in the Bionator group demonstrated significant gains in handwriting at 12-month follow-up, whilst children in the standard occupational therapy group did not. This study demonstrates that children with CP who receive 5 weeks of the Bionator intervention, compared with an activity-matched, standard occupational therapy intervention, achieve significantly greater improvements in upper limb function. Furthermore, the gains are maintained over a 12-month period. 859 So.2d 763 (2003) Jeffrey ULYSSES v. BETTY J. ALEXANDER, M.D. No. 03-CA-214. Court c6a93da74d
